

CASE STUDY

How our Sirocco excels in the removal of invasive Japanese Knotweed

Japanese knotweed is the absolute definition of an invasive plant. It is the single most common invasive weed species to be found in UK. It is a vigorous and invasive plant that spreads rapidly causing damage to buildings, paths and roads as it is capable of breaking through concrete. It can cause serious structural damage as it continues to grow. Japanese Knotweed is virtually impossible to budge by conventional means and returns again and again, despite best efforts at its eradication. The good news is there are solutions out there to combat these issues and remove knotweed once and for all.

“Our Sirocco excels in two areas, Complete destruction of invasive plants at source and doing so with little or no cost. The fuel-free Sirocco was designed to succeed with both outcomes in mind. The Sirocco lets you achieve this with ease.”

**Andy Mayor -
Production Engineering
Advisor**

Japanese Knotweed Management Company is a company based in Northern Ireland that are experts in the removal of invasive plants. They recently contacted us and purchased our Inciner8 Sirocco to help with this vast problem after hearing positive reports about the Sirocco from other professionals in their sector.

The inciner8 Sirocco comes into its own by being fully operational without the need for fuel. Not only does this dramatically lower running costs but it makes transporting the Sirocco extremely easy and safe. This is achieved by using Inciner8's cyclonic air technology which uses a high-pressured fan to pull air into the main drum to create a high oxygen environment. This creates optimum conditions for invasive plant combustion and can remove up to 15kg's per hour in its 200-litre combustion chamber. With the success of the Sirocco in dealing with invasive plants, it is not only a great financial opportunity for gardening & landscaping businesses but also a for property developers and households should they be dealing with a big invasive plant problem.
